Lanterns in black and white design

Instructions No. 439

Difficulty: Beginner

Working time: 15 Minutes

Snowflakes do not always have to be white. On the bulbous lantern glasses black pearls are placed directly into decorative snow - very filigree and elegant!

Preparation

Before you start with the decorative bonding of the glass, clean the glass surface with glass cleaner (free of grease and dust).

Pearl ice crystal

Set a square gemstone as the "centre" of the Scheeflocke or place several black pearls in a centre point. Stick it on with some decorative snow.

Gluing with decorative snow

Apply a line of decorative snow, place four Twin Beads beads on top with tweezers and press lightly, place a black Acrylic-Pearl at the end of the track. Three more beads are added at right angles around the middle Stone
Important: Always place the beads directly into the wet decorative snow. When it dries, the beads will no longer stick to it

In the next step, place four more Crystal-beads between these beads, add four Twin Beads beads to each of them. Add small branches - for this purpose, place one black rocaille Pearl upright in the decorative snow. Let the decorative snow dry well.

Snow-glass edge

Place more snowflakes around the Wind light according to your personal taste.

Place a trace of decorative snow around the upper edge, cover it with Rocailles close together or alternatively create a "snow edge with noses" with the liner.

This idea is timelessly beautiful!
